

Ritual

A high-precision sans with a confident voice.

Ritual is a high-precision sans with a confident voice. Its DNA fuses elements from two different facets of the Swiss-German tradition: the neo-grotesk and the geometric sans serif. One of Ritual's defining features is its horizontal terminals, a trait that's characteristic for the rationalized grotesks associated with mid-20th century modernism. This lineage is infused with a different approach featuring more architectural elements. The constructivist angle becomes evident in the almost circular shapes of round letters, and is also visible in the straight-forward diagonals (see R, Q, y, 1). The latter are a nod to Neuzeit S, a revision of an earlier geometric sans, optimized in the 1960s for the use in corporate design. So are the round dots in diacritical and punctuation marks, which help to establish a contemporary and approachable impression. Ritual is distinguished by its clear-cut shapes and a fine-tuned balance of black and white.

Planet Mercury — Since Mercury wears no concealing veil of atmosphere, and displays markings that can be identified and followed, a surprising circumstance has come to light. In 1889, Schiaparelli discovered that Mercury, instead of rotating on its axis in about 24 hours like the Earth and Mars, rotates in 88 days; that is to say, it always turns the same face towards the Sun, just as the Moon turns the same face towards the Earth. This fact, confirmed theoretically by **Prof. G. H. Darwin** in his development of the theory of tidal friction, puts the condition of mercury in quite a new light. No alternation of day or night refreshes and restores the little world; one hemisphere is for ever exposed to the blasting heat of the Sun, seven times hotter for it than for the Earth; the other hemisphere is for ever exposed to the darkness and cold of outer space, a range from something like 390° celsius above freezing-point, to 270° celsius below. It is true that between the two hemispheres there is a “debatable land,” for, owing to the ellipticity of the orbit, the face turned to the Sun is not exactly the same at all times, and a region about 47° in width on each side of the planet, that is to say, rather more than a quarter of its entire surface, has one day and one night in each period of 88 days, but these more favoured sections can scarcely be considered more habitable than the rest.

Venus and Saturn — But in the telescope Venus appears less satisfying. It is a pretty spectacle indeed to watch the phases of the gleaming little globe of silver, for, like the moon under varying illumination from the Sun, it undergoes change of apparent shape. But the surface of the planet yields little detail, and that little is illusive and ill-defined. The clear-cut outlines and black shadows of the Moon have no place here, nor do the ruddy plains and blue-grey “seas” of mars find any analogues. All that can be observed beyond the changes of phase are a few faint, ill-defined patches, where the molten silver of the general surface is slightly dimmed and tarnished, and perhaps one or two spots, not less evasive and

Ein Betriebssystem, auch OS (von englisch operating system) genannt, ist eine Zusammenstellung von Computerprogrammen, die die Systemressourcen eines Computers wie Arbeitsspeicher, Festplatten, Ein- und Ausgabegeräte verwaltet und diese Anwendungsprogrammen zur Verfügung stellt. Das Betriebssystem bildet dadurch die Schnittstelle zwischen den Hardware-Komponenten und der Anwendungssoftware des Benutzers.[2] Betriebssysteme bestehen in der Regel aus einem Kernel (deutsch: Kern), der die Hardware des Computers verwaltet, sowie speziellen Programmen, die beim Start unterschiedliche Aufgaben übernehmen. Zu diesen Aufgaben gehört unter anderem das Laden von Gerätetreibern. Betriebssysteme finden sich in fast allen Arten von Computern:

Det betyder i princippet at uanset hvilket program som anvendes på styresystemet, gives adgang til alle printerdrivere og skrifter. Hvis man senere får eller køber flere printere (med printerdrivere) og flere skrifter, skal de kun installeres én gang i styresystemet. Det sparer arbejdstid og evt. fejlfinding, da man ikke behøver at have og installere separate printerdrivere og skrifter i sine programmer. Både for at undgå at skulle programmere de samme ting flere gange til flere programmer, men også for at få et ensartet udseende i alle programmer. The DAX (Deutscher Aktienindex (German stock index) is a blue chip stock market index consisting of the 30 major German companies trading on the Frankfurt Stock Exchange. Prices are taken from the Xetra trading venue. According to Deutsche Börse, the operator of Xetra, DAX measures the performance of the Prime Standard's 30 largest German companies in terms of order book volume and market capitalization. It is the equivalent of the FTSE 100 and the Dow Jones Industrial Average, and because of its small selection it does not necessarily represent the vitality of the economy as a whole.
